

NEW LAUNCHING

## 'Southern Ranger'

### **Superstructure:**

After the alloy was prepped Nyalic® was applied as an etch primer to give the ultimate envelope protection from corrosion.

A standard paint system was then applied. This consisted of 3 coats epoxy H/B Primer. After sanding H/B 3 coats of polyurethane topcoat were applied.

Allowing topcoat to cure (to paint manufactures specification) then 2 coats of Nyalic® were applied. End result is a high gloss finish, which prevents corrosion, resists most chemicals, wont fade and which is easy maintained for the crew.

### **Bare Aluminium:**

The surface was prepared by acid washing the aluminium followed by a fresh water wash. Then a wash down with a bicarbonate of soda and water mix. This being followed by a fresh water wash to give a neutral p/h. Two coats of Nyalic® were then applied.
